INTRODUCTION

Welcome to the Antonov An-2 User Guide! ATSimulations, in cooperation with Microsoft and Asobo, is happy to present the updated version of the Antonov An-2!

The An-2 is one of aviation’s most distinctive aircraft, both visually and in its place in history. It was conceived and designed to meet a Soviet Ministry of Forestry request for a utility aircraft. The result was one of the most widely-used airplanes in aviation history. Due to its robust and highly-survivable design, adaptability, positive and responsive control at slow speeds, power, and load carrying ability, it was adopted for more than forty uses, from agriculture to military purposes. Over 18,000 An-2s were manufactured over the course of its 45-year production run. The aircraft has operated in dozens of countries for a broad spectrum of uses, from airline transport to military roles. Its ability to fly low and slow, while maintaining full pilot control, helped earn it the status of aviation legend.

This package comprises several An-2 iterations based on landing gear configuration: wheels, skis, and floats. These virtual renditions replicate all of the An-2’s features in exquisite detail, including exteriors and interiors (with high-definition textures), photorealistic and fully-functional cockpits, true-to-life audio, and realistic flight dynamics. We worked closely with actual An-2 pilots in creating these renditions to provide the most realistic experience for flight simulator users. Enjoy your An-2 cockpit time!

We recommend that you invest time into learning about the An-2 and its unique flight dynamics by reading this user guide before jumping into its cockpit and lifting into the sky. Even if you are an experienced real-world pilot or an advanced Microsoft Flight Simulator user, you’ll find certain concepts contained in this guide to be invaluable for your An-2 experience.

The following sections provide information about operating the Antonov An-2, historical facts about the airframe, flight configurations, a performance guide, and pre-flight and post-flight checklists.

Have fun!

All base images Copyright the Microsoft Corporation except Public Domain images on Pages 6 and 7.
SYSTEM REQUIREMENTS

- Microsoft Flight Simulator 2020
- Available hard drive space: 3 GB
- Other: mouse, joystick, sound card, speakers/headphones, TrackIR

FEATURES

3D Models
- Accurate exterior and interior models created with 3D scan technology
- 4k textures with specular, bump, and reflection maps
- FPS friendly

Panel & Gauges
- All gauges are developed using 3D parts
- Realistic night lighting

Systems
- Fully simulated electrical system
- Partly simulated pneumatic system
- Realistic engine starting sequence
- Simulated window freezing and window heating system

Flight dynamics
- Flight dynamics were developed in close cooperation with experienced An-2 pilots

Sounds
- Engine sounds recorded from an actual An-2
- All switches, knobs and levers operate with realistic audio
HISTORY OF THE ANTONOV AN-2

The An-2 is a single-engine, multi-role, utility biplane developed by aerospace engineer Oleg Antonov for agricultural and forestry purposes. It is notable for its short take-off and landing (STOL) capability, its versatility, ruggedness, and slow-speed performance. Over 18,000 were manufactured over a record 45-year production run, making it one of the most prolific of all aircraft in aviation history, and one of the most influential. It has been used for myriad purposes, from crop dusting to military applications. Users bestowed a number of nicknames to the An-2 over the decades, including its most common, “Kukuruznik,” a Russian word meaning “related with corn,” a fitting reference to its agricultural heritage. It also has been called “Annushka,” (“Annie”). The NATO reporting name for the An-2 is “Colt.”

THE AN-2: THE LEGEND’S BEGINNINGS

The An-2 traces its roots to the 1930s, when Soviet aerospace engineer Oleg Antonov envisioned a tough, single-engine utility biplane that could serve a wide range of civil needs. Years later, in 1946, the Soviet government gave Antonov his opportunity. The Ministry of Forestry sought a replacement for the Polikarpov Po-2, an open-cockpit, tandem two-seat biplane used as a general utility aircraft. The top-secret Soviet Research and Design Bureau Number 153 (OKB-153), which would later become Antonov State Enterprise, was established on May 31, 1946. Its first project was the biplane that Antonov had conceptualized years earlier.

One of Antonov’s greatest influences during the engineering stage of his aircraft was the wing design of the Fieseler Fi 156 Storch, a German military liaison airplane that was renowned for its excellent STOL performance. Antonov sought to replicate the Storch’s great slow-speed flying characteristics and its ability to operate out of austere, unimproved airfields. The engineer’s merging of the myriad functional goals of his prospect (including his original ideas), the guidelines set forth by the Ministry of Forestry, and the performance of the Fi 156, would prove a great, and historically enduring, success.

Antonov’s design was an all-metal biplane comprising an enclosed cockpit and a cabin that could accommodate 12 seats. The first prototype, designated SKh-1, was powered by a Shvetsov Ash-21 7-cylinder radial engine. The aircraft took its maiden flight on August 31, 1947. The test pilot reportedly remarked after landing that the aircraft performed flawlessly and that his only criticism was that the seat was not adjusted.
properly for his height. The second iteration of the aircraft used a Shvetsov Ash-62 9-cylinder radial engine, bringing the payload capability up to 4,720 pounds from 2,870 pounds. Designated the An-2, Antonov’s aircraft was ready for serial production, which was slated to take place in Kiev, Ukraine.

In late 1952 the Soviet government halted plans for production of the An-2 at the Kiev factory to focus on building fuselage components for the Ilyushin Il-28 bomber. Since the order was signed by Stalin, there would be no appeal. Six months later, however, Stalin died. An-2 production restarted in Kiev, and by 1960, 5,000 units had rolled off the assembly line. Production was continued later in Dolgoprudniy, Russian SFSR. The majority of An-2 production took place at Poland’s WSK factory in the city of Mielec. More than 13,000 units were produced by the time full production ended in 1991. Limited production continued until 2001, with four aircraft produced for Vietnam. China has also produced the airframe under license, which it calls the Shijiazhuang Y-5. While some sources have claimed that East Germany produced the An-2, the country only refurbished some aircraft. In all, more than 18,000 An-2s were manufactured between the Soviet Union, Poland, and China.
THE AN-2’S OPERATIONAL HISTORY

The An-2 was quickly adopted throughout the Soviet Union and other Eastern Bloc countries as soon as it started rolling off the assembly line in Kiev. It was initially used for agricultural purposes, notably for crop dusting. The aircraft was also used in its early operational days for mineral prospecting.

The spectrum of use of the An-2 broadened each year after its introduction. It helped hunters by providing information on animal and bird habitat. It was used extensively for aerial photography to aid hydrologic and other physical science research work. It was used as a small airliner, transporting people, cargo, and mail. It was used to monitor oil pipelines and electricity networks, and it was used to transport materials for highway and other infrastructure projects.

Twenty-six countries have procured An-2s for their air forces and civil organizations. Due to the aircraft’s versatility - notably its modifiability - excellent handling at slow speeds, power, and forgivingness, it has seen adaptation over the decades for more than 40 specific applications. Some special applications and modifications have included: Sampling air quality, water bombing forest fires, air ambulances, crop dusting, lightly armed combat variants for the insertion of paratroopers, and civilian parachuting. The most common variant is the An-2T, a 12-seat passenger version that today is very popular among civilian parachute clubs.

Oleg Antonov stated that the aircraft itself would be its best advocate. He said: “If they make at least 50 An-2s then a bright future will be ensured for it.” He was correct in his prediction, as evidenced by the more than 18,000 produced.

Why did the An-2 become so popular? What is so special about the aircraft?

When asked, Oleg Antonov noted: “I think it is due to its flight parameters first of all: short take-off and landing distances, simplicity of piloting and operation. This machine is undemanding to the airfields.” He further explained that the An-2’s success and ubiquity was due to its versatility and adaptability; that its form, power, ruggedness, and flight profile throughout such a broad range of speeds and conditions make it uniquely qualified to modify into a wide range of specialized aircraft.
From an overarching design standpoint, the success of the Antonov derives from simplicity and reliability. This includes ensuring that all aerodynamic control surfaces are actuated with sufficiently powerful systems. The resilient and reliable operation of the aircraft is a function of the wing design. The An-2 incorporates automatic leading-edge slats and flaperons that provide aircraft stability during high angle-of-attack (AoA) maneuvers. The wing design is such that it is virtually impossible to stall the An-2 while under power with flaps extended. The An-2 is so inherently aerodynamically stable that even without any pilot control input, the aircraft, while powered, will recover to a horizontal flight profile, even when placed into a flat spin.

A note from the original pilot's handbook reads: "If the engine quits in instrument conditions or at night, the pilot should pull the control column full aft and keep the wings level. The leading-edge slats will snap out at about 64 km/h (40 mph), and when the airplane slows to a forward speed of about 40 km/h (25 mph), the airplane will sink at about a parachute descent rate until the aircraft hits the ground."

The An-2 indeed has no stall speed quoted in the operating handbook. Pilots of the An-2 say one can fly the aircraft in full control at an airspeed of just 30 miles per hour. The An-2’s low stall speed makes it possible for the aircraft to “fly backwards,” relative to the ground (granted it is flying into a headwind of more than about 31 or 32 miles per hour).

**COMBAT SERVICE**

Although it was designed originally to provide aerial support for agriculture and forestry, the An-2’s incredible versatility soon caught the attention of military practitioners. The An-2 has seen military use for a number of mission sets, including logistical support (as a freighter), information operations (dropping leaflets), as an ISR (intelligence, surveillance, and reconnaissance) data collections platform, as a light bomber and surface attack aircraft (including maritime torpedo use), and recently as an unmanned combat air vehicle in the role of loitering munition.

The first verifiable military use of the An-2 occurred during the Hungarian Revolution of 1956, when the aircraft was used to drop informational leaflets and also for ISR gathering.

An-2s were used in the war in Indochina. DRV (Democratic Republic of Vietnam) Air Force An-2s ferried equipment, personnel, weapons, and ammunition to its allies in the civil war in Laos.
During the Vietnam War, the An-2 was modified to carry torpedoes and used as a naval interdiction platform. Its slow speed proved advantageous, as aircraft dispatched to intercept An-2s could not engage them due to their slow flight. The STOL capability of the An-2 proved particularly beneficial, as it could operate out of small, unimproved airfields hacked into the jungle.

In Cambodia in 1970, government forces used the An-2 to carry supplies to troops during operations against guerrillas. In 1979, An-2s were used in Cambodia by the Kmer Rouge for both logistical support and as forward air controllers.

During the Croatian War of Independence in 1991, An-2s initially used as crop dusters were converted to drop improvised bombs and as supply ships.

During the Second Nagorno-Karabakh War in 2020, the Azerbaijanis converted old An-2s into loitering munitions by fitting them with video cameras, remote controls, and high explosives, then flying them into enemy positions and detonating the explosives.

**THE AN-2 TODAY**

Since the collapse of the Soviet Union and the Eastern European communist states, most airlines in these areas have been withdrawing their An-2s from service, as some of these aircraft are now over 40 years old and the production dwindled. Private operators are still using the An-2, as their stability, capaciousness, and slow-flying ability make them very popular, notably for skydiving.

While their high noise levels, increasing maintenance costs, high fuel consumption, and unsophisticated nature (the pre-flight checks alone take between 30 and 40 minutes) make them obsolete for commercial service in Europe today, the large number of aircraft available has lowered their resale value (each can be purchased for as little as $30,000). They are ideal for the developing world, where their ability to carry large loads into short airstrips makes them advantageous to airlines on a budget. Many ex-Aeroflot An-2s work as regional airliners in Africa, Central and South America, Cuba, and Southeast Asia.

North Korea has a number of the aircraft using wooden propellers and canvas wings (the Y-5 version that was license-built in China). This construction gives them a reduced radar cross-section, and therefore a limited degree of "stealth." In a war they could possibly be used to parachute or deliver special operations troops behind enemy lines for sabotage operations.
The An-2's ability, looks, flying characteristics, and status as one of the world's largest single-engine biplanes, has increased the demand for the An-2 in the United States and Western Europe. The airframe is prized by collectors of classic aircraft, making them an increasingly common sight at airshows. However, nearly all western nations (the USA, Canada, the United Kingdom, France, etc.) prohibit the use of the An-2 commercially, despite its obvious potential as a bush plane and parachute aircraft. This is because the aircraft has not been certified by the relevant national aviation authorities, limiting its use.

The An-2 remains recognized as outstanding in its class and has many admirers throughout the world. As of 2007, more than 4,000 An-2s remain in operation. Many have been flying for more than 40 years and remain in excellent condition.

In 2012, the Ministry of Transport of the Russian Federation announced the initiation of the An-2 Deep Modernization Program, which includes the replacement of engines and other critical operational equipment.
AN-2 SPECIFICATIONS

The An-2 is a single-engine, short take-off and landing (STOL), utility biplane designed in the Soviet Union for agricultural and forestry use. The design comprises an all-metal, stressed-skin monocoque fuselage, an empennage consisting of metal framing and fabric covering, and metal-framed, fabric-covered wings (with the upper wing longer than the lower wing). The An-2 is renowned for its exceptional slow-speed and short-field performance. This is due primarily to the wings of the aircraft, notably the full-length, leading-edge slats and aileron-flap actuation system. The An-2 took its maiden flight on August 31, 1947 and over 18,000 have been produced.

Dimensions
- Length: 12.7 m (40 ft 8 in)
- Height: 5.35 m (13 ft 2 in)
- Wing span: 18.2 m (59 ft 8 in)
- Wing area: 71.52 m² (769.8 sq ft)

Engine
Shvetsov ASh-62 9-cylinder radial engine (which was a development of the Wright R-1820 Cyclone) 1000 hp, displacement 30 liters.

Fuel
Total tank capacity: 317 US galls (1200 litters)

Air speeds
- Max speed: 258 km/h (160 mph)
- Cruising speed: 190 km/h (120 mph)
- Stall speed: 50 km/h (30 mph)

Performance
- Range: 845 km (525 miles)
- Service ceiling: 4500 m (14,750 ft)
- Rate of climb: 3.5 m/sec (700 ft/min)
- Take-off distance: 170-490 m (560-1600 ft)
- Landing distance: 425 m (1400 ft)

Weight
- Empty weight: 3300 kg (7300 lbs)
- Max take-off: 5500 kg (12000 lbs)
### Panels and Controls

#### Main Panel

1. Radio altimeter signal lamp
2. Airspeed indicator
3. Attitude indicator
4. Antifire system ready lamp
5. "Fire" signal lamp
6. Fire extinguisher button
7. Starter circuit breaker
8. Magneto knob
9. Starter switch (Left click activates electric motor to rotate flywheel. Right click - clutch flywheel to engine)
10. Directional gyro
11. Ammeter
12. Generator lamp
13. Manifold pressure indicator
14. Altitude indicator
15. Vertical speed indicator
16. "Fast slave" button
17. UGR compass
18. RPM indicator
19. Chip detector signal lamp
20. Oil dilution signal lamp
21. Left tank low fuel signal lamp
22. Right tank low fuel signal lamp
23. Marker signal lamp
24. Cylinders heads temperature indicator
25. Radio altimeter indicator
26. Fuel meter indicator
27. Carburetor temperature indicator
28. Engine gauge (Fuel pressure, oil pressure and oil temperature indicators)
29. Cabin fresh air panel lever (Left)
30. Cabin fresh air panel lever (Right)
31. Up wing flaps circuit breaker
32. Flaps master circuit breaker
33. Low wing flaps circuit breaker
34. Aileron trimmer circuit breaker
35. Elevator trimmer circuit breaker
36. Rudder trimmer circuit breaker
37. Comm radio circuit breaker
38. GPS switch
39. Intercom circuit breaker
40. ADF circuit breaker
41. Marker circuit breaker
42. Radioaltimeter circuit breaker
43. Oil shutters circuit breaker
44. Cowl flaps circuit breaker
45. Antifire system circuit breaker
46. Cabin light circuit breaker
47. Panel light circuit breaker
48. Cockpit light circuit breaker
49. Pitot heat circuit breaker
50. UV lamps circuit breaker
51. Portable lamp circuit breaker (inoperable)
52. Floor light circuit breaker (inoperable)
53. Ampervoltmeter
54. Power inverter switch (Left click - main. Right click - aux)
55. Aux power inverter signal lamp
56. Tail wheel lock signal lamp
57. Tail wheel lock switch
58. Left land light switch
59. Right land light switch
60. Navigation lights switch
61. Taxi light switch
62. Strobe lights switch
63. (inop) (Beacon light for airplane where it exist)
64. Generator switch
65. Battery switch
66. Copilot's attitude indicator power switch
67. Pilot's attitude indicator power switch
68. Fuel meters power switch
69. Engine gauge power switch
70. Oil shutters and cowl flaps indicators power switch
71. Thermometers power switch
72. Air filter shutter lever
73. "Door open" signal lamp
74. COM radio
75. Emergency flaps up switch
76. Flaps position indicator
77. Oil shutters position indicator
78. "Altitude corrector" lever (Mixture)
79. Flaps low button
80. Throttle lever
81. Propeller lever
82. Carburetor heat lever
83. Fuel cut valve lever
84. "Aileron trimmer in zero" signal lamp (+-2 deg.)
85. "Elevator trimmer in zero" signal lamp (+-2 deg.)
86. "Rudder trimmer in zero" signal lamp (+-2 deg.)
87. Rudder trimmer switch (left click - left, right click - right)
88. Rise flaps button
89. Elevator trimmer switch (left click - low, right click - up)
90. Aileron trimmer switch (left click - left wing low, right click - right wing low)
91. Oil shutters switch
92. Cowl flaps switch
93. Lamp
94. Window heat knob
95. Clock
96. Attitude indicator
97. UGK-2 compass
98. Power inverter voltmeter
99. ADF control panel
100. Airspeed indicator
101. Outside temperature indicator
102. "Fast slave" button
103. UV lamps rheostats (inop)
104. ADF indicator
105. Vertical speed indicator
106. Altimeter indicator

ENGINE CONTROLS

**Throttle Control**

The throttle is the outboard lever which is mechanically connected to the carburetor by a flexible push-pull type cable. The full forward position of the throttle is OPEN and the full aft position is CLOSED.

**Standard shortcuts:**
- Cut Throttle: [F1]
- Decrease Throttle: [F2 or Num Pad 3]
- Increase Throttle: [F3 or Num Pad 9]
- Full Throttle: [F4]

**Mixture Control (Altitude Corrector)**

The mixture lever enables the pilot to regulate the fuel-air mixture to the engine to obtain efficient engine operation and maximum fuel economy at cruise. The RICH position is full backward, full forward is IDLE CUT-OFF, and manual leaning is accomplished by placing the lever between the RICH and IDLE CUT-OFF positions. Actually the An-2’s pilots use altitude corrector very rare, on some airplanes it was even sealed in FULL RICH position.

**Standard shortcuts:**
- Set Mixture to Idle Cut-off: [CTRL+SHIFT+F1]
- Lean Mixture: [CTRL+SHIFT+F2]
- Enrich Mixture: [CTRL+SHIFT+F3]
- Set Mixture to Rich: [CTRL+SHIFT+F4]

**Magneto**

The engine magneto switch controls the dual magneto system. There are four switch positions, designated counterclockwise as follows: BOTH, L, R and OFF. The engine is started and operated with the switch in the BOTH position. The L and R positions are for confirmation purposes only.
Starter

The starter circuit breaker (7) provides power to the starter control switch (9). Starter switch has three positions: **left** (left click) - provides power to electric motor which rotates the flywheel; **neutral** (right click from the left, automatically from the right) – power off; **right** (right click from neutral) - activates clutch which connects flywheel to the engine’s crankshaft.

**FUEL CONTROLS**

**Fuel Supply System**

Fuel is supplied to the engine from two equally-sized fuel tanks located in the upper wing. From these tanks, fuel flows through a fuel selector valve, a manual fuel pump, a boost pump, a fuel strainer, and an engine-driven fuel pump to the carburetor.

**Fuel Quantity Indicator**

A direct reading, electrically actuated fuel quantity indicator is mounted in the main pilot’s panel (26). Indicator shows whole, left tank or right tank fuel quantity. The mode is chosen by a three-position switch (124). Additionally, the aircraft has a low fuel signal lamp for each of the two tanks to indicate when fuel level is less than 50 liters (21 and 22).

**Note:** To use fuel quantity indicator, the battery and circuit breaker (68) must be **ON**.
Fuel Selector Valve

A rotary type fuel-tank selector-valve handle is incorporated in the fuel system. The fuel-tank selector-valve handle, which controls the fuel selector valve through mechanical linkage, has four positions: LEFT TANK, RIGHT TANK, BOTH TANKS and FUEL OFF. The RIGHT TANK, LEFT TANK and BOTH TANKS positions allow fuel to flow from the appropriate tank(s) to the engine. The FUEL OFF position seals both tanks from the other components of the fuel system and inhibits fuel from flowing beyond the selector valve. The fuel selector rotates clockwise with left click and anticlockwise with right click.

Fuel Boost Pumps

An-2 has two fuel pumps, manual and electric. The manual pump is operated by a lever (132). The electric pump is controlled by an ON/OFF switch located on the right-hand side of the instrument panel.
FLIGHT CONTROLS

Wing Flaps

Wing-flap buttons (79 and 88) control the flaps. To lower the flaps, use button on the throttle lever side (79). To raise the flaps, use button on the lower left corner of the pedestal.

Note: to operate flaps motors, battery and circuit breakers 31-33 must be ON.

Standard Shortcuts:
Retract Flaps (fully) [F5]
Retract Flaps (in increments) [F6]
Extend Flaps (in increments) [F7]
Extend Flaps (fully) [F8]

Wing Flap Indicator

The position of the flaps can be determined by looking at the flaps position indicator (76). There are indication marks at 0, 15, 30, 45 and flaps can be selected at these settings or any setting in between.

Note: to use flaps position indicator battery and circuit breaker 70 must be ON.
Trim Tabs

An-2 has electrical controlled trim tabs for all three control axes. Each trim motor is connected to a three-position control tumbler (87, 89, 90). To indicate neutral tabs positions the airplane has control lamp for each axe (84, 85, 86).

**Note:** to operate trim motors battery and circuit breakers 34-36 must be **ON**.

**Standard Shortcuts:**

- **Elevator Trim Down** [Num Pad 7]
- **Elevator Trim Up** [Num Pad 1]
- **Aileron Trim Left Wing Low** [Num Pad 4]
- **Aileron Trim Left Wing Up** [Num Pad 6]
- **Rudder Trim Left** [Num Pad 0]
- **Rudder Trim Right** [Num Pad Enter]

**WINDOW HEAT CONTROL**

Flying in cold weather conditions can cause window freezing. To counter the visual obscuration this causes, use window heat (tumblers 116-118) and cabin ventilation knobs (on the floor between pilots). Window icing depends on the temperature difference between aircraft interior and exterior. To control temperature inside the cockpit you use the thermometer directly behind left-side pilot head. Check the outside temperature or set it up manually.
CHECKLISTS AND PERFORMANCE
Antonov An-2

PRE-START PROCEDURES AND CHECKS

Control lock: REMOVED & STOWED
Parking brake: SET
Log book, flight doc. & legal forms: On board
All switches: OFF
Magneto switch: OFF
Windows: CLEAN
Propeller: CLEAN
Engine cowling latches: ALL CLOSED & LOCKED
Oil cooler: CLEAN
Dust filter: Check position
Tires condition & pressure (40 PSI): no defects, no gasoline leaks
Left & right wings: REMOVED
Pitot cover: CLEAN
Navigation & landing lights glasses: no cracks, no deformations
Side fuselage

INTERIOR CHECK – NIGHT FLIGHTS

Battery: ON
Interior/external lights: all ON – check for serviceability

BEFORE STARTING

Oil collector can: REMOVED & STOWED
Doorstep: REMOVED & STOWED

TAKE-OFF

1. Without flaps:
Engine parameters
Speed up to

9 / 2100
140 Km/h 75 Kts

1. With flaps (wind <20 Kts): reduces take off distance by 35%
If 15°: engine
If 25°: engine

9 / 2100
9 / 2100
If 30°: engine (max weight) 10.5 / 2200
Rotation speed 85 - 90 Km/h 48 Kts
Sped up to 120 Km/h 65 Kts
Flaps over 150 Ft gradually drawn-in
Full drawing of flaps at 140 Km/h 75 Kts

**CLIMB**

Establish initially 9 / 2050 (9 / 2100 if urgent)
When altitude > 150 Ft 8.5 / 1850
Speed 140 – 150 Km/h CHECK
Oil T° < 70° CHECK
CHT < 215° CHECK
Lights Considered

**CRUISE**

Oil T° 60° - 75° CHECK
CHT: 120° - 215° (recommended: 150° - 215°) CHECK
Oil Pressure 4 - 5 CHECK
Fuel Pressure 0.25 - 0.35 CHECK
Compressor pressure 45 – 50 CHECK
Voltages > 28.5 V & > 75 V CHECK
Flaps 0°

**DESCENT**

Establish 5.2 / 1500 (= 180 Km/h 97 Kts)
Maximum speed for descent:
Quiet air 220 Km/h 119 Kts
Turbulent air 190 Km/h 102 Kts
Maintain CHT > 120° & Oil T° > 50° ON
Carburetor heater if OAT < -15° BOTH
Fuel selector CONFIRM OFF & PRESSURE IN BRAKES "0"
Parking break CHECK
Air pressure > 40 AS REQUIRED
Flaps

**FINAL CHECK**

Throttle < 5 FULL PITCH
Propeller < 140 Km/h 75 Kts
Speed CHOOSE SETTING (usually 15°) ON
Flaps
Landing lights
